

# HW3: Induction

Golam Md Muktadir

May 4, 2019

$$\frac{\langle x, \sigma \rangle \Downarrow \sigma(x) \quad \frac{\langle y, \sigma \rangle \Downarrow \sigma(y) \quad \langle z, \sigma \rangle \Downarrow \sigma(z)}{\langle y + z, \sigma \rangle \Downarrow \sigma(y) + \sigma(z)}}{\langle x * (y + z), \sigma \rangle \Downarrow \sigma(x) * (\sigma(y) + \sigma(z))}$$

## 1 Problem 1

### 1.1 Question

In the WHILE language, prove or disprove the equivalence of the two commands:

$$t := x; x := y; y := t$$

and

$$t := y; y := x; x := t$$

(where x; y, and t are distinct locations).

### 1.2 Answer

We can disprove it with a counter example with a state  $s$  in which two sequences yield different results.

Let

$$s = [t \rightarrow 0, x \rightarrow 5, y \rightarrow 100]$$

Then,

$$\begin{aligned} \langle t := x; x := y; y := t, s \rangle &\Downarrow s[t \rightarrow 5, x \rightarrow 100, y \rightarrow 5] \\ \langle t := y; y := x; x := t, s \rangle &\Downarrow s[t \rightarrow 100, x \rightarrow 100, y \rightarrow 5] \end{aligned}$$

So, location,  $t$ , has different values after execution of the sequences under this  $s$ .

## 2 Problem 2

### 2.1 Question

In the WHILE language, prove that if

$$\langle \text{while } b \text{ do } y := y - x, s \rangle \Downarrow s'$$

then there exists an integer  $k$  such that

$$s(y) = s'(y) + k * s(x)$$

Please make it explicit if/when you reason by induction on derivations, stating your induction hypothesis.

## 2.2 Answer

We can prove it by induction on the derivation of while command.

Let us define,

$$W = \text{while } b \text{ do } y := y - x$$

$$\sigma_i = s[y := y - (k - i) * x]$$

$$P(n) := \langle W, \sigma_n \rangle \Downarrow \sigma_o$$

So,

$$\sigma_o = s[y := y - k * x] = s'$$

$$\sigma_k = s[y := y - x]$$

**Base case:**  $i = 0$

$$D: \frac{\langle b, \sigma_o \rangle \Downarrow false \quad \langle skip, \sigma_o \rangle \Downarrow \sigma_o}{\langle W, \sigma_o \rangle \Downarrow \sigma_o} \text{ (by } iff_{sos}, while_{sos} \text{)}$$

So,  $P(0)$  holds.

**Induction case:**  $\forall i \leq n, P(i)$  **holds**,  $n \in \mathbb{N}$  We need to show that  $P(n+1)$  holds, too.

$$D: \frac{D1 : \langle b, \sigma_o \rangle \Downarrow true \quad D2 : \langle y := y - x, \sigma_{n+1} \rangle \Downarrow \sigma_n \quad D' : \langle W, \sigma_n \rangle \Downarrow \sigma_o}{\langle W, \sigma_{n+1} \rangle \Downarrow \sigma_o} \text{ (by } while_{sos} \text{)}$$

Derivation of D2:

$$D2: \frac{\langle y := y - x, s[y := y - k * x + (n + 1) * x] \rangle \rightarrow s[y := y - k * x + (n) * x]}{\langle y := y - x, \sigma_{n+1} \rangle \Downarrow \sigma_n} \text{ (by } ass_{sos} \text{)}$$

Now  $D'$  is true by our induction hypothesis. So,  $P(n+1)$  holds.

So, we proved  $\sigma_o$  to be our terminal state. We can see from the definition of it that,

$$\sigma_o(y) = s(y) - k * x$$

$$\Rightarrow s'(y) = s(y) - k * x$$

$$\Rightarrow s(y) = s'(y) + k * x \text{ (Proved)}$$

## 3 Problem 3

### 3.1 Question

In the WHILE language, prove:

$$\forall c1, c2, c3 : c1; (c2; c3) \equiv (c1; c2); c3$$

### 3.2 Answer
